AGILE OPERATIONS SOFTWARE

Real-time management
and maintenance of a city

NAVIA™ is a software solution that brings together all the management and maintenance of the infrastructures and activities of a city, compiling information in a single system about services, public amenities, departments and resources, such as garden maintenance, car parks, public lighting, etc.

By concentrating and organising all the information produced, NAVIA™ allows the real-time monitoring of how operations are progressing, the resources used and all the activity of the teams on the ground, anytime, anywhere. But NAVIA™ is more than simply a software package for management. It is a collaborative platform and a working tool for all the employees, teams and departments, who regardless of their function, location or level of specialisation can consult the tasks they have to carry out and register the data collected, providing the information when it is needed.

NAVIA™, the command room for all operations in your city.

NAVIA
AGILE OPERATIONS SOFTWARE

Add an app to your command room.
Involve your citizens with the new Navia™ Smart City App.

In addition to ensuring total collaboration among the various teams, departments and operations, Navia now allows citizens to directly participate in the management of their city through the new NAVIA™ Smart City App. Using this application, it is possible to receive information directly from the local residents about any occurrences, forwarding it to the respective department and then giving feedback to the citizens. Furthermore, through the App the municipality can inform its citizens in advance of any works, improvements, problems or occurrences, in a direct, personal and safe manner. It is a perfect example of participatory citizenship in the form of an app.

Learn about some of the main features of NAVIA™.

Reduce shifts, travel and tasks.
Save on resources. Be more sustainable.

The total coordination among departments and the access to real-time information allows the effective planning of all the activities, making sure there is no repetition of tasks, waste of resources or delays in implementation. This all adds up to lower costs and a bigger budget available.

No operation is too large or too small.

Define the size and number of operations of your infrastructure, process or territory in an autonomous and user-friendly manner. Specify the equipment, locations, shifts, resources and materials needed using a solution that is completely adaptable and customisable.

Define tasks, shifts and parameters.

Prepare the whole operation in advance, directly on the system and share it immediately with your teams and staff. Define tasks per team, individual and shift. Make processes more flexible, set parameters, select methods and monitor their implementation in real time.

Management for quality, sustainability and safety.

With all the procedures specified, shared and properly managed, NAVIA™ is the ideal tool for the implementation of environmental quality and safety management systems. In other words, much more than helping you obtain certification, NAVIA™ allows you to put it into action in your team on a daily basis.

Management of alarms and occurrences.

Define alarms in advance for certain kinds of occurrences. Establish parameters and intervals for certain data, which will trigger an alarm if they are exceeded to enable immediate, preventive and rational action.

Contact us and find out how Navia can help you in your everyday operations.
