

NAVIA
AGILE OPERATIONS SOFTWARE

Save on costs, tasks, shifts, travel and resources. Make better decisions. Learn about Navia Water Operations.

Managing the water supply or sanitation system of a city is probably one of the biggest challenges when it comes to managing infrastructures.

It involves a complex and demanding management system that requires coordination of multiple variables. The information flow is constant, immense and diverse both in terms of its sources and its formats. Multiple, inter-dependent teams are set up in accordance with their skills, goals and locations. The operation is continuous and the excellence of the supply requires systematic quality control and maintenance of the infrastructures.

The appraisal, control and consequent management of all this information is therefore a highly demanding task, in which innovation and technology play an essential role in simplifying the decision-making processes.

Navia Water Operations is a technological solution developed specifically for the operational management of water and sanitation systems, which allows the complete integration of all the activities, tasks and data into a single collaborative system, simplifying the decision-making process.

NAVIA
AGILE OPERATIONS SOFTWARE

Navia Water Operations

Complete management of the urban water cycle in a single software package.

Navia Water Operations is a system that compiles and supports all the operations, data and tasks in a single management software package. Its collaborative nature allows the information to be gathered per infrastructure, team or individual, using the same device, allowing the real-time monitoring and assessment of all the tasks and data. To sum up, it controls the entire operation in one software package, which can be used anywhere.

Learn about some of the benefits of Navia Water Operations:

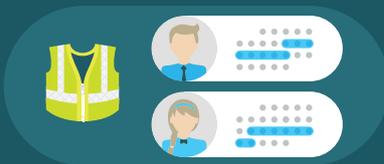

Organisation of the data and setting the parameters of the system.

Define equipment, locations, teams and materials in a system that is fully configurable and adaptable to your management model, and the characteristics of your infrastructure.

Complete integration and compatibility.

Navia is a web system that is compatible with any kind of hardware or operating system so its implementation is immediate. Its huge degree of flexibility also allows the integration and compilation of data from other software programs such as GIS, LINS, ERP, CRM, BILLING.

Define tasks per team and per individual.

Prepare the whole operation in advance directly on the system and share it immediately with all the staff members. Define tasks per team, individual and shift. Make processes more agile, set parameters and select the methods used.

Mobility and real-time feedback.

As a web solution, the teams on the ground and the management are permanently connected. Online or offline, through a simple tablet, the teams on the ground can access the system and insert data, images and GPS locations, supplying all the information in real time.

View, download and analyse data in real time.

With all the information compiled in a single system, you can obtain reports, view data, analyse and assess tasks in real time. At any moment, you can check the time and resources expended per team, individual or location.

Contact us and find out how Navia can help you in your everyday operations.
